## Rock Gardening

ONE of the many delights in gardening is to attempt the unusual and to succeed, and there is nothing that offers more possibilities for novel enterprise and originality of design than planning and making a Rock Garden.

There is no fixed precedent or any standard model to guide one; the same proposition can be approached in a hundred different ways, allowing a grand opportunity to demonstrate structural skill, novel design and originality of idea, combined with the best selection of subjects and subsequent correct and effective disposition in the planting.

Whether "natural" or "made to order" the Rock Garden today is the pet "show" place in most gardens and one of the most interesting plots to which the host may proudly lead his guests. No garden is complete without its collection of Rock Plants. They are creating more interest every day. The wide range and peculiar forms of the different species, with their odd flowers and often freakish character of growth, offer a new picture to study each day in the year, and memorize as the blooms appear from month to month.

## My Aim

IS TO provide HEALTHY, WELL-ROOTED ROCK PLANTS that will start to grow as soon as they are transplanted to their new home.

Plants that are too small and not sufficiently rooted will not do this, and old field grown plants often lose so much of their root system in transplanting that they have a hard time to re-establish themselves.

My plants are all young, healthy and just the right size to make a new start. I will cheerfully replace any plant that does not do so.

My nursery is small and I hire no help. All plants are grown, dug, packed and shipped by me, so if they are not right I cannot blame anyone else. The experienced rock gardener will find many choice varieties in this list. For the beginner, I strongly advise one of the collections.

Have small quantities of many varieties not listed and would be glad to quote prices on same.

All rock garden authorities recommend planting several plants of a few varieties, rather than single plants of many varieties.

I have endeavored to give in a concise way the principle things one needs to know in selecting plants for a rock garden, namely,—the color, height, time of blooming and something of the habit of the plant, spreading, tufted, cluster or rosette type. The height given here is the extreme height of the flower stems. I have also made some notations as to whether plants prefer sun or shade.

All plants are 25c each; 3 of one variety for 65c; 6 for \$1.25; 12 for \$2.50, unless otherwise priced in the list.
